CLydonAssignment2

March 2, 2022

1 Assignment 2

- 1) Read chapters 2-4 in your textbook and review the coding examples we went over in class
- 2) Review the Keras documentation for things like the Layer types and Optimizer types to better familiarize yourself
- 3) Redo the coding examples and do the "Further experiments" in chapter 3 of your book with datasets you find interesting and may want to use for further assignments and projects
- 4) Provide a brief write up of the experiment and analysis.

2 table of contents

- 1. import libraries
- 2. data prep
 - 1. reading data
 - 2. finding summary data
 - 3. dummyizing data
 - 4. creating predictor & outcome attribute lists
 - 5. transforming data into numpy arrays
 - 6. creating training and testing data
 - 7. standardizing the data (z-scoring)
- 3. modeling
 - 1. initial model
 - 1. building layers
 - 2. fitting model on training data
 - 3. predicting with test data
 - 2. further experiments
 - 1. model using one hidden layer
 - 2. model using more hidden units
 - 3. model using mae loss
 - 4. model using tanh activation
 - 3. kfold optimization
 - 1. build model function definition
 - 2. defining k-fold variables
 - 3. k-fold loop
 - 4. plotting k-fold results
 - 5. building model from validation

2.1 1 import libraries

```
[1]: # data prep
from sklearn.preprocessing import StandardScaler, MinMaxScaler
from sklearn.model_selection import train_test_split

import numpy as np
import pandas as pd

# keras imports
from keras import models
from keras import layers
from keras import optimizers

# random seed for pseudo-random operations
random_seed = 100
```

Using TensorFlow backend.

2.2 2 data prep

2.1 reading dataset

```
[2]: math_data = pd.read_csv("https://raw.githubusercontent.com/connoralydon/

datasets/main/student-math.csv", sep=";")
```

data can be found here

Attributes for both student-mat.csv (Math course) and student-por.csv (Portuguese language course) datasets: 1 school - student's school (binary: 'GP' - Gabriel Pereira or 'MS' - Mousinho da Silveira) 2 sex - student's sex (binary: 'F' - female or 'M' - male) 3 age - student's age (numeric: from 15 to 22) 4 address - student's home address type (binary: 'U' - urban or 'R' rural) 5 famsize - family size (binary: 'LE3' - less or equal to 3 or 'GT3' - greater than 3) 6 Pstatus - parent's cohabitation status (binary: 'T' - living together or 'A' - apart) 7 Medu - mother's education (numeric: 0 - none, 1 - primary education (4th grade), 2 â€" 5th to 9th grade, 3 â€" secondary education or 4 â€" higher education) 8 Fedu - father's education (numeric: 0 - none, 1 primary education (4th grade), 2 â€" 5th to 9th grade, 3 â€" secondary education or 4 â€" higher education) 9 Mjob - mother's job (nominal: 'teacher', 'health' care related, civil 'services' (e.g. administrative or police), 'at home' or 'other') 10 Fjob - father's job (nominal: 'teacher', 'health' care related, civil 'services' (e.g. administrative or police), 'at_home' or 'other') 11 reason - reason to choose this school (nominal: close to 'home', school 'reputation', 'course' preference or 'other') 12 guardian - student's guardian (nominal: 'mother', 'father' or 'other') 13 traveltime - home to school travel time (numeric: $1 - \langle 15 \text{ min.}, 2 - 15 \text{ to } 30 \text{ min.}, 3 - 30 \text{ min.} \text{ to } 1 \text{ hour, or } 4 - \langle 15 \text{ hour} \rangle$ 14 studytime - weekly study time (numeric: 1 - <2 hours, 2 - 2 to 5 hours, 3 - 5 to 10 hours, or 4 ->10 hours) 15 failures - number of past class failures (numeric: n if 1<=n<3, else 4) 16 schoolsup - extra educational support (binary: yes or no) 17 famsup - family educational support (binary: yes or no) 18 paid - extra paid classes within the course subject (Math or Portuguese) (binary: yes or no) 19 activities - extra-curricular activities (binary: yes or no) 20 nursery - attended nursery school (binary: yes or no) 21 higher - wants to take higher education (binary: yes or no) 22 internet - Internet access at home (binary: yes or no) 23 romantic - with a romantic relationship (binary: yes or no) 24 famrel - quality of family relationships (numeric: from 1 - very bad to 5 - excellent) 25 freetime - free time after school (numeric: from 1 - very low to 5 - very high) 26 goout - going out with friends (numeric: from 1 - very low to 5 - very high) 27 Dalc - workday alcohol consumption (numeric: from 1 - very low to 5 - very high) 28 Walc - weekend alcohol consumption (numeric: from 1 - very low to 5 - very high) 29 health - current health status (numeric: from 1 - very bad to 5 - very good) 30 absences - number of school absences (numeric: from 0 to 93) these grades are related with the course subject, Math or Portuguese: 31 G1 - first period grade (numeric: from 0 to 20) 31 G2 - second period grade (numeric: from 0 to 20) and G2 - second period grade (numeric: from 0 to 20) and G2 - second period grade (numeric: from 0 to 20) and G2 - second period grade (numeric: from 0 to 20) and G2 - second period grade (numeric: from 0 to 20) and G2 - second period grade (numeric: from 0 to 20) and G2 - second period grade (numeric: from 0 to 20) and G2 - second period grade (numeric: from 0 to 20) and G2 - second period grade (numeric: from 0 to 20) and G2 - second period grade (numeric: from 0 to 20) and G2 - second period grade (numeric: from 0 to 20) and G2 - second period grade (numeric: from 0 to 20) and G2 - second period grade (numeric: from 0 to 20) and G2 - second period grade (numeric: from 0 to 20) and G2 - second period grade (numeric: from 0 to 20) and G2 - second period grade (numeric: from 0 to 20) and G2 - second period grade (numeric: from 0 to 20) and G2 - second period grade (numeric: from 0 to 20) and G2 - second period grade (numeric: from 0 to 20) and G2 - second period grade (numeric: fro

     2.3 dummyizing data
[11]: categorical_cols = {}
      for col in math_data.columns:
          if(math_data[col].dtype == "object"):
              categorical_cols[col] = list(math_data[col].unique())
      numerical_cols = list(set(math_data.columns) - set(categorical_cols.keys())) #__
      \rightarrowset difference
      math_data_dummy = pd.get_dummies(math_data, columns = categorical_cols.keys())
```

2.4 model variables removing g1, g2, g3 because they would be highly autocorrelary. someone who does good on one test is likely t odo good on another.

```
[12]: predictors = list(math_data_dummy.columns)
    predictors.remove("G1") # first exam
    predictors.remove("G2") # second exam
    predictors.remove("G3") # third exam

outcome = "G3"
```

2.5 transforming data into numpy arrays this is because keras won't take pandas dataframes

```
[13]: X = np.array(math_data_dummy[predictors])
y = np.array(math_data_dummy[outcome])
```

2.6 creating training and testing data

2.7 standardizing the data (z-scoring) to avoid wildy wiferent values in the model

```
[15]: z = StandardScaler() # standard scaling object

# z = MinMaxScaler() # alternative min max scaler so all values should lie

between 0-1 for training and about that for testing

# fitting scaler object to training data then outputting it

X_train = z.fit_transform(X_train)

# fit the testing data on the distributions found in the training data

X_test = z.transform(X_test)
```

2.3 3 modeling

3.1 building initial model

```
2022-03-02 00:32:31.494001: I tensorflow/core/platform/cpu_feature_guard.cc:145] This TensorFlow binary is optimized with Intel(R) MKL-DNN to use the following CPU instructions in performance critical operations: SSE4.1 SSE4.2 To enable them in non-MKL-DNN operations, rebuild TensorFlow with the appropriate compiler flags.
2022-03-02 00:32:31.495570: I tensorflow/core/common runtime/process_util.cc:115] Creating new thread pool
```

with default inter op setting: 8. Tune using inter_op_parallelism_threads for best performance.

3.1.1 compiling model loss

```

3.1.3 predicting with test data

```
[19]: predicted = model.evaluate(X_test, y_test)
    print(f"test: mean squared error loss {predicted[0]}")
    print(f"test: mean absolute error loss {predicted[1]}")
```

```
79/79 [=======] - 0s 973us/step test: mean squared error loss 15.218327860288982 test: mean absolute error loss 3.1643083095550537
```

3.2 further experiments The following experiments will help convince you that the architecture choices you've made are all fairly reasonable, although there's still room for improvement: 1. You used two hidden layers. Try using one or three hidden layers, and see how doing so affects validation and test accuracy. 2. Try using layers with more hidden units or fewer hidden units: 32 units, 64 units, and so on. 3. Try using the mae loss function instead of mse. 4. Try using the tanh activation (an activation that was popular in the early days of neural networks) instead of relu.

3.2.1 model using one hidden layer

```
[20]: model_slim = models.Sequential()
model_slim.add(layers.Dense(32, activation='relu', input_shape=(X_train.
→shape[1],)))
model_slim.add(layers.Dropout(0.3, seed=random_seed)) # adding dropout layers
→to help with overfitting
```

```
model_slim.add(layers.Dense(1)) # adding this layer because it is a regression ⊔
\rightarrow problem
model_slim.compile(optimizer='rmsprop',
    loss='mse',
    metrics=['mae'])

    print(f"test: mean absolute error loss {predicted_tanh[1]}")
```

lots more loss in a model that uses a tanh actuvation vs relu activation for this neural network geometry

3.3~k~fold~validation the code here is taken out of the textbook for the regression examples

3.3.1 build model function definition

3.3.2 defining k-fold variables

```
[29]: n_folds = 10
num_epochs = 20
num_val_samples = len(X_train) // n_folds
all_mae_histories = []
```

3.3.3 k-fold loop

```
for i in range(n_folds):
    print("processing fold #", i)
    val_data = X_train[i * num_val_samples : (i + 1) * num_val_samples]
    val_targets = y_train[i * num_val_samples : (i + 1) * num_val_samples]

partial_train_data = np.concatenate(
    [X_train[:i * num_val_samples],
        X_train[(i + 1) * num_val_samples:]],
        axis = 0)

partial_train_targets = np.concatenate(
    [y_train[:i * num_val_samples],
        y_train[(i + 1) * num_val_samples:]],
        axis = 0)

model = build_model()
history = model.fit(partial_train_data, partial_train_targets,
```

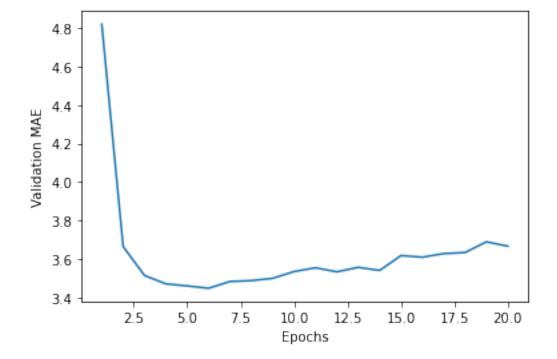

```
validation_data=(val_data, val_targets),
  epochs=num_epochs, batch_size=1, verbose=0)

mae_history = history.history['val_mae']
all_mae_histories.append(mae_history)
```

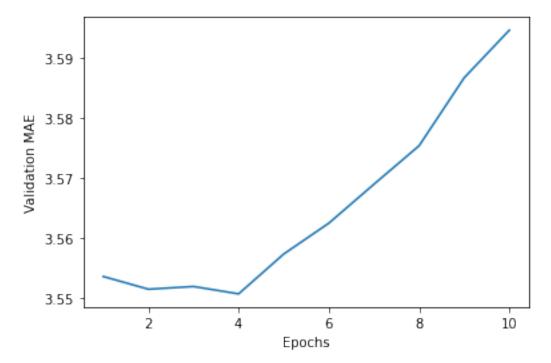

```
processing fold # 0
processing fold # 1
processing fold # 2
processing fold # 3
processing fold # 4
processing fold # 5
processing fold # 6
processing fold # 7
processing fold # 8
processing fold # 8
```

3.3.4 plotting k-fold results

```
[32]: import matplotlib.pyplot as plt
   plt.plot(range(1, len(average_mae_history) + 1), average_mae_history)
   plt.xlabel('Epochs')
   plt.ylabel('Validation MAE')
   plt.show()
```

looks like validation mean absolute error is minimized at around 10 epochs or so

this shows the average validation score vs number of epochs. it goes up over the epochs, but is not that different in absolute terms.

3.3.5 building model from validation

```
[34]: model = build_model()
  model.fit(X_train, y_train,
     epochs = 10, batch_size = 20)
  test_mse_score, test_mae_score = model.evaluate(X_test, y_test)
  print(f"testing mean absolute error {test_mae_score}")
 Epoch 1/10
 10.2354
 Epoch 2/10
 9.4563
 Epoch 3/10
 8.7767
 Epoch 4/10
 8.0436
 Epoch 5/10
 7.2385
 Epoch 6/10
 6.3765
 Epoch 7/10
 5.5143
 Epoch 8/10
 4.6974
 Epoch 9/10
 4.0408
 Epoch 10/10
 79/79 [======== ] - 0s 723us/step
```

the mean absolute error for the testing error is 3.3 grade units out of 20. this model does pretty well and is not far off from the training data. 3.26 mae in training and 3.3 in testing. epochs of 10 are a good way to normalize it for this network geometry.

testing mean absolute error 3.7550230026245117
